-!- FUNCTION: Plays a role in signal transduction by regulating the
intracellular concentration of cyclic nucleotides. This
phosphodiesterase is highly specific for cAMP and may have a role
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     skeletal muscle.
DOMAIN: Composed of a C-terminal catalytic domain containing two
putative divalent metal sites and an N-terminal regulatory domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Name=2; Synonyms=PDE7A1;

"Structure of two rat genes coding for closely related rolipram—
"Structure of two rat genes coding for closely related rolipram—
from alternative cAMP phosphodiesterases. Multiple mRNA variants originate
from alternative splicing and multiple start sites.";
J. Bloi. Chem. 269:347-357(1994).
-!- CATALYTIC ACTIVITY: Adenosine 3',5'-cyclic phosphate + H(2)0 =
adenosine 5'-phosphate.
-!- PAZXME REGULATION: Inhibited by rolipram.
-!- PAZMANY: Cyclic nucleotide metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isold=P14646-2; Sequence=VSP 004573;
-!- SIMILARITY: Belongs to the cyclic nucleotide phosphodiesterase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Event=Alternative splicing, Named isoforms=3;

Chem. 268:64/0-64/0 (1993).
FUNCTION: May be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti-inflammatory agents.

CATALYTIC ACTIVITY: Adenosine 3',5'-cyclic phosphate + H(2)0 = adenosine 5'-phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: Belongs to the cyclic nucleotide phosphodiesterase

Submitted (JUL-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Plays a role in signal transduction by regulating the intracellular concentration of cyclic nuclectides. This phosphodiesterase, which has a high affinity for CAMP, may be involved in maintaining basal levels of the cyclic nuclectide and/or in the CAMP regulation of germ cell development.

-!- CATALYTIC ACTIVITY: Adenosine 3',5'-cyclic phosphate + H(2)0 = adenosine 5'-phosphate.

-!- CATALYTIC ACTIVITY: Adenosine 3',5'-cyclic phosphate + H(2)0 = cyclic nuclectide and/or in the cAMP regulation of germ cell development.

-!- COFACTOR: Requires divalent cations. Magnesium or manganese are required for maximum activity, in vitro.

-!- ENEXME REGULATION: Inhibited by dipyridimole. Insensitive to as lot the non-selective including rollpram and zaprinast as well as to the non-selective inhibitor, IBMX. Unaffected by GMP. small intestine and colon. DOMAIN: Composed of a C-terminal catalytic domain containing two putative divalent metal sites and an N-terminal regulatory domain. SEQUENCE OF 117-829 FROM N.A. (ISOFORMS 1 AND 2).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          REBULT 7
A40949

Yordic-AMP phosphodiesterase (EC 3.1.4.-) - rat
NyAlternate names: PDS4/IVb long form
C;Species: Rattus norvegicus (Norway rat)
C;Date: 13-May-1992 #sequence revision 13-May-1992 #text_change 09-Jun-2000
C;Accession: A40949; D33904; Ā53109; 167942
